

FOOD PRODUCT PACKAGE HAVING
NESTED CUP AND CUP HOLDER

ABSTRACT OF THE DISCLOSURE

5

A package for a food product that is packaged in dry form and is prepared by adding liquid such as hot water, comprises a primary container formed as a tapered plastic drinking cup, and a cup holder also formed as a tapered plastic cup. The primary container and cup holder are configured so they are nestable inside each other. The package is convertible between a packaged configuration in which the cup holder is nested inside the primary container, and a serving configuration in which the primary container is nested inside the cup holder. The food product can be contained in the primary container or in the cup holder. A membrane can seal the cup holder closed. An outer wrapper such as a shrink band or label can hold the cup holder in the primary container and provide tamper evidence, and can also serve as a moisture and/or oxygen barrier.
